

PAIN PROGRESSION OVER SEVERAL YEARS

Phycox and CBD is IMPORTANT through all subsequent phases. But it doesn't work all by itself forever. And if your dog is fat, NOTHING hardly makes a difference because the "trouble walking" is LITERALLY a mechanical, strength and agility issues.

Either way: Sooner or later you end up adding the following to CBD & Phycox:

CBD & Phycox + Buffered Aspirin 4 Days A Week

Then Swap For

CBD & Phycox + Deramaxx as needed - *Then*

CBD & Phycox + Deramaxx all the time - *Then*

CBD & Phycox + Deramaxx all the time and Gabapentin - *Then*

CBD & Phycox + Deramaxx + Gabapentin + Methocarbamol - *Then*

CBD & Phycox + Deramaxx + Gabapentin + Methocarbamol + Tramadol - *Then*

CBD & Phycox + Steroids + Famotidine - *Then*

CBD & Phycox + Steroids + Famotidine + Gabapentin - *Then*

CBD & Phycox + Steroids + Gabapentin + Methocarbamol - *Then*

CBD & Phycox + Steroids + Gabapentin + Methocarbamol + Tramadol

Then I don't know what we'll do. Acupuncture? Chiropractic?

When they legalize THC as part of cannabis therapy, we'll see a quantum leap in arthritis management for dogs and cats. This is probably coming soon. As soon as John Morgan (Morgan & Morgan, "For the People") gives the go-ahead for the Florida legislature to legalize marijuana, Georgia will be right behind them as a "me too" tax participant.

If your dog is fat, NOTHING, hardly, makes a difference.

"Doc those meds he's on, they're not working." – "Yes, but he's very heavy. He's got to lose weight." - "He's not heavy, he barely eats, and he's just big-boned. Just a big dog!" – "Okay, if you say so."

You'll notice **NARCOTICS** are not on the list. That's because by the time you're down for narcotics, the dog should probably be crossing the Rainbow Bridge.
